Chapter 1

Yubico YubiKey NEO Manager C Library

This is a C library to interact with the YubiKey NEO. There is a command line tool "ykneomgr" for interactive use. It supports querying the YubiKey NEO for firmware version, operation mode (OTP/CCID) and serial number. You may also mode switch the device and manage applets (list, delete and install).

For more information about Yubico and the YubiKey, see: https://www.yubico.com/

Object Hierarchy

Description

Functions

ykneomgr_global_init ()

```
ykneomgr_rc
ykneomgr_global_init (ykneomgr_initflags flags);
```

Initialize the library. This function is not guaranteed to be thread safe and must be invoked on application startup.

Parameters

```
flags initialization flags, ORed ykneomgr_initflags.
```

Returns

On success YKNEOMGR_OK (integer 0) is returned, and on errors an ykneomgr_rc error code.

ykneomgr_global_done ()

```
void
ykneomgr_global_done (void);
```

Release all resources from the library. Call this function when no further use of the library is needed.

ykneomgr_strerror()

```
const char~*
ykneomgr_strerror (int err);
```

Convert return code to human readable string explanation of the reason for the particular error code.

This string can be used to output a diagnostic message to the user.

This function is one of few in the library that can be used without a successful call to wkeeperglobal_init().

Parameters

```
err error code
```

Returns

Returns a pointer to a statically allocated string containing an explanation of the error code err.

ykneomgr_strerror_name ()

```
const char~*
ykneomgr_strerror_name (int err);
```

Convert return code to human readable string representing the error code symbol itself. For example, ykneomgr_strerror_name(YKNEO! returns the string "YKNEOMGR_OK".

This string can be used to output a diagnostic message to the user.

This function is one of few in the library that can be used without a successful call to ykneomgr_global_init().

Parameters

err error code

Returns

Returns a pointer to a statically allocated string containing a string version of the error code err, or NULL if the error code is not known.

ykneomgr_init ()

```
ykneomgr_rc
ykneomgr_init (ykneomgr_dev **dev);
```

Create a YubiKey NEO device handle. The handle must be deallocated using ykneomgr_done() when you no longer need it.

Parameters

dev pointer to newly allocated device handle.

Returns

On success, YKNEOMGR_OK (integer 0) is returned, or another ykneomgr_rc error code.

ykneomgr_done ()

```
void
ykneomgr_done (ykneomgr_dev *dev);
```

Release all resources allocated to a YubiKey NEO device handle.

Parameters

dev device handle to deallocate, created by ykneomgr_init().

ykneomgr_list_devices ()

List devices.

Parameters

dev	a ykneomgr_dev device	
	handle.	
devicestr	output buffer to hold string,	
devicesti	or NULL.	
	on input length of	
len	devicestr buffer, on	
	output holds output length	

Returns

On success, YKNEOMGR_OK (integer 0) is returned, or another ykneomgr_rc error code.

ykneomgr_connect ()

Establish connection to a named PCSC device and verify that it has the YubiKey OTP applet. The name string should be a PCSC device name; you can use ykneomgr_list_devices() to list connected devices.

Parameters

dev	a ykneomgr_dev device handle.	
name	input string with device	
name	name to connect to.	

Returns

On success, YKNEOMGR_OK (integer 0) is returned, when no device could be found YKNEOMGR_NO_DEVICE is returned, or another ykneomgr_rc error code.

ykneomgr_discover ()

```
ykneomgr_rc
ykneomgr_discover (ykneomgr_dev *dev);
```

Discover and establish connection to the first found YubiKey NEO. A YubiKey NEO is identified by having the YubiKey OTP applet installed, i.e., a connect followed by attempting to select the YubiKey OTP applet.

Parameters

dov	a ykneomgr_dev device
dev	handle.

Returns

On success, YKNEOMGR_OK (integer 0) is returned, when no device could be found YKNEOMGR_NO_DEVICE is returned, otherwise another ykneomgr_rc error code is returned.

ykneomgr_get_version_major ()

```
uint8_t
ykneomgr_get_version_major (ykneomgr_dev *dev);
```

Get major version of a YubiKey NEO. Versions are in the form of MAJOR.MINOR.BUILD, for example 3.0.4, in which case this function would return 3.

Parameters

Returns

the YubiKey NEO major version number.

ykneomgr_get_version_minor()

```
uint8_t
ykneomgr_get_version_minor (ykneomgr_dev *dev);
```

Get minor version of a YubiKey NEO. Versions are in the form of MINOR.MINOR.BUILD, for example 3.0.4, in which case this function would return 0.

Parameters

```
dev a ykneomgr_dev device handle.
```

Returns

the YubiKey NEO minor version number.

ykneomgr_get_version_build ()

```
uint8_t
ykneomgr_get_version_build (ykneomgr_dev *dev);
```

Get build version of a YubiKey NEO. Versions are in the form of BUILD.MINOR.BUILD, for example 3.0.4, in which case this function would return 4.

Parameters

```
dev a ykneomgr_dev device handle.
```

Returns

the YubiKey NEO build version number.

ykneomgr_get_mode ()

```
uint8_t
ykneomgr_get_mode (ykneomgr_dev *dev);
```

Get mode of a YubiKey NEO.

Parameters

dev	a ykneomgr_dev device
ucv	handle.

Returns

the YubiKey NEO device mode.

ykneomgr_get_serialno ()

```
uint32_t
ykneomgr_get_serialno (ykneomgr_dev *dev);
```

Get serial number of a YubiKey NEO, if visible.

Parameters

dev	a ykneomgr_dev device
dev	handle.

Returns

the YubiKey NEO device mode, or 0 if not visible.

ykneomgr_modeswitch ()

Mode switch a YubiKey NEO.

Parameters

dev	a ykneomgr_dev device handle.	
mode	new mode to switch the device into	

Returns

On success, YKNEOMGR_OK (integer 0) is returned, or another ykneomgr_rc error code.

ykneomgr_authenticate ()

Authenticate to the device, to prepare for privileged function access.

Parameters

dev	a ykneomgr_dev device handle.	
kov	Double-DES key in binary,	
key	16 bytes	

Returns

On success, YKNEOMGR_OK (integer 0) is returned, or another ykneomgr_rc error code.

ykneomgr_applet_list ()

List installed applets.

Parameters

dev	a ykneomgr_dev device handle.	
appletstr	output buffer to hold string,	
	or NULL.	
	on input length of	
len	appletstr buffer, on	
	output holds output length	

Returns

On success, YKNEOMGR_OK (integer 0) is returned, or another ykneomgr_rc error code.

ykneomgr_applet_delete ()

Delete specified applet.

Parameters

dev	a ykneomgr_dev device handle.	
aid	aid to delete.	
aidlen	length of aid buffer.	

Returns

On success, YKNEOMGR_OK (integer 0) is returned, or another ykneomgr_rc error code.

ykneomgr_applet_install ()

Install specified applet.

Parameters

dev	a ykneomgr_dev device handle.	
capfile	string with path filename to CAP file	

Returns

On success, YKNEOMGR_OK (integer 0) is returned, or another ykneomgr_rc error code.

Types and Values

1.3 ykneomgr-version

ykneomgr-version —

Functions

const char *	ykneomgr_	check	version ()

Types and Values

#define	YKNEOMGR_VERSION_STRING
#define	YKNEOMGR_VERSION_NUMBER
#define	YKNEOMGR_VERSION_MAJOR
#define	YKNEOMGR_VERSION_MINOR
#define	YKNEOMGR VERSION PATCH

Object Hierarchy

Description

Functions

ykneomgr_check_version()

```
const char~*
ykneomgr_check_version (const char *req_version);
```

Check that the version of the library is at minimum the requested one and return the version string; return NULL if the condition is not satisfied. If a NULL is passed to this function, no check is done, but the version string is simply returned.

See YKNEOMGR_VERSION_STRING for a suitable req_version string.

Parameters

req_version	Required version number, or NULL.
-------------	-----------------------------------

Returns

Version string of run-time library, or NULL if the run-time library does not meet the required version number.

Types and Values

YKNEOMGR_VERSION_STRING

```
#define YKNEOMGR_VERSION_STRING "0.1.4"
```

Pre-processor symbol with a string that describe the header file version number. Used together with ykneomgr_check_version() to verify header file and run-time library consistency.

YKNEOMGR VERSION NUMBER

```
#define YKNEOMGR_VERSION_NUMBER 0x000104
```

Pre-processor symbol with a hexadecimal value describing the header file version number. For example, when the header version is 1.2.3 this symbol will have the value 0x01020300. The last two digits are only used between public releases, and will otherwise be 00.

YKNEOMGR_VERSION_MAJOR

```
#define YKNEOMGR_VERSION_MAJOR 0
```

Pre-processor symbol with a decimal value that describe the major level of the header file version number. For example, when the header version is 1.2.3 this symbol will be 1.

YKNEOMGR_VERSION_MINOR

```
#define YKNEOMGR_VERSION_MINOR 1
```

Pre-processor symbol with a decimal value that describe the minor level of the header file version number. For example, when the header version is 1.2.3 this symbol will be 2.

YKNEOMGR_VERSION_PATCH

```
#define YKNEOMGR_VERSION_PATCH 4
```

Pre-processor symbol with a decimal value that describe the patch level of the header file version number. For example, when the header version is 1.2.3 this symbol will be 3.
