## **Chapter 1**

# Yubico YubiKey NEO Manager C Library

This is a C library to interact with the YubiKey NEO. There is a command line tool "ykneomgr" for interactive use. It supports querying the YubiKey NEO for firmware version, operation mode (OTP/CCID) and serial number. You may also mode switch the device and manage applets (list, delete and install).

For more information about Yubico and the YubiKey, see: https://www.yubico.com/

## 1.1 ykneomgr

ykneomgr ---

#### **Synopsis**

```
ykneomgr_rc
                     ykneomgr_applet_delete
                                                           (ykneomgr_dev *dev,
                                                           const uint8_t *aid,
                                                           size_t aidlen);
ykneomgr_rc
                     ykneomgr_applet_install
                                                           (ykneomgr_dev *dev,
                                                           const char *capfile);
ykneomgr_rc
                     ykneomgr_applet_list
                                                           (ykneomgr_dev *dev,
                                                           char *appletstr,
                                                           size_t *len);
ykneomgr_rc
                     ykneomgr_authenticate
                                                           (ykneomgr_dev *dev,
                                                           const uint8_t *key);
                                                           (ykneomgr_dev *dev,
ykneomgr_rc
                     ykneomgr_connect
                                                            const char *name);
                     ykneomgr discover
                                                           (ykneomgr dev *dev);

```

## **Description**

## **Details**

#### ykneomgr\_applet\_delete ()

Delete specified applet.

dev: a ykneomgr\_dev device handle.

aid: aid to delete.

aidlen: length of aid buffer.

**Returns:** On success, YKNEOMGR\_OK (integer 0) is returned, or another ykneomgr\_rc error code.

## ykneomgr\_applet\_install ()

Install specified applet.

dev: a ykneomgr\_dev device handle.

capfile: string with path filename to CAP file

**Returns:** On success, YKNEOMGR\_OK (integer 0) is returned, or another ykneomgr\_rc error code.

## ykneomgr\_applet\_list ()

List installed applets.

dev: a ykneomgr\_dev device handle.

appletstr: output buffer to hold string, or NULL.

len: on input length of appletstr buffer, on output holds output length

**Returns:** On success, YKNEOMGR\_OK (integer 0) is returned, or another ykneomgr\_rc error code.

#### ykneomgr\_authenticate ()

ykneomgr_rc	ykneomgr_authenticate	(ykneomgr_dev *dev,
		<pre>const uint8_t *key);</pre>

Authenticate to the device, to prepare for privileged function access.

dev: a ykneomgr\_dev device handle.

key: Double-DES key in binary, 16 bytes

Returns: On success, YKNEOMGR\_OK (integer 0) is returned, or another ykneomgr\_rc error code.

#### ykneomgr\_connect ()

Establish connection to a named PCSC device and verify that it has the YubiKey NEO applet. The name string should be a PCSC device name; you can use the command line tool "pcsc\_scan" to list connected devices.

dev: a ykneomgr\_dev device handle.

name: input string with device name to connect to.

**Returns:** On success, YKNEOMGR\_OK (integer 0) is returned, when no device could be found YKNEOMGR\_NO\_DEVICE is returned, or another ykneomgr\_rc error code.

#### ykneomgr discover ()

Discover and establish connection to a YubiKey NEO. The function will return an error if more than one device is present, or if no device is present.

dev: a ykneomgr\_dev device handle.

**Returns:** On success, YKNEOMGR\_OK (integer 0) is returned, when no device could be found YKNEOMGR\_NO\_DEVICE is returned, when too many devices are present YKNEOMGR\_TOO\_MANY\_DEVICES is returned, or another ykneomgr\_rc error code.

## ykneomgr\_done ()

Release all resources allocated to a YubiKey NEO device handle.

dev: device handle to deallocate, created by ykneomgr\_init().

## ykneomgr\_get\_mode ()

Get mode of a YubiKey NEO.

dev: a ykneomgr\_dev device handle.

Returns: the YubiKey NEO device mode.

#### ykneomgr\_get\_serialno ()

Get serial number of a YubiKey NEO, if visible.

dev: a ykneomgr\_dev device handle.

Returns: the YubiKey NEO device mode, or 0 if not visible.

#### ykneomgr\_get\_version\_build ()

Get build version of a YubiKey NEO. Versions are in the form of BUILD.MINOR.BUILD, for example 3.0.4, in which case this function would return 4.

dev: a ykneomgr\_dev device handle.

Returns: the YubiKey NEO build version number.

#### ykneomgr\_get\_version\_major ()

Get major version of a YubiKey NEO. Versions are in the form of MAJOR.MINOR.BUILD, for example 3.0.4, in which case this function would return 3.

dev: a ykneomgr\_dev device handle.

Returns: the YubiKey NEO major version number.

#### ykneomgr\_get\_version\_minor ()

Get minor version of a YubiKey NEO. Versions are in the form of MINOR.MINOR.BUILD, for example 3.0.4, in which case this function would return 0.

dev: a ykneomgr\_dev device handle.

Returns: the YubiKey NEO minor version number.

#### ykneomgr\_global\_done ()

void ykneomgr\_global\_done (void);

Release all resources from the library. Call this function when no further use of the library is needed.

## ykneomgr\_global\_init ()

ykneomgr\_rc ykneomgr\_global\_init (ykneomgr\_initflags flags);

Initialize the library. This function is not guaranteed to be thread safe and must be invoked on application startup.

flags: initialization flags, ORed ykneomgr\_initflags.

**Returns:** On success YKNEOMGR\_OK (integer 0) is returned, and on errors an ykneomgr\_rc error code.

#### ykneomgr\_init ()

Create a YubiKey NEO device handle. The handle must be deallocated using <a href="mailto:ykneomgr\_done">ykneomgr\_done</a>() when you no longer need it.

dev: pointer to newly allocated device handle.

**Returns:** On success, YKNEOMGR\_OK (integer 0) is returned, or another ykneomgr\_rc error code.

#### ykneomgr list devices ()

List devices.

dev: a ykneomgr\_dev device handle.

devicestr: output buffer to hold string, or NULL.

len: on input length of devicestr buffer, on output holds output length

Returns: On success, YKNEOMGR\_OK (integer 0) is returned, or another ykneomgr\_rc error code.

#### ykneomgr\_modeswitch()

Mode switch a YubiKey NEO.

dev: a ykneomgr\_dev device handle.

mode: new mode to switch the device into

Returns: On success, YKNEOMGR\_OK (integer 0) is returned, or another ykneomgr\_rc error code.

#### ykneomgr\_strerror()

```
const char * ykneomgr_strerror (int err);
```

Convert return code to human readable string explanation of the reason for the particular error code.

This string can be used to output a diagnostic message to the user.

This function is one of few in the library that can be used without a successful call to ykneomgr\_global\_init().

err: error code

Returns: Returns a pointer to a statically allocated string containing an explanation of the error code err.

#### ykneomgr\_strerror\_name ()

```
const char * ykneomgr_strerror_name (int err);
```

Convert return code to human readable string representing the error code symbol itself. For example, ykneomgr\_strerror\_name(YKNEOMRection returns the string "YKNEOMGR\_OK".

This string can be used to output a diagnostic message to the user.

This function is one of few in the library that can be used without a successful call to <a href="ykneomgr\_global\_init">ykneomgr\_global\_init</a>().

err: error code

**Returns:** Returns a pointer to a statically allocated string containing a string version of the error code err, or NULL if the error code is not known.

## 1.2 ykneomgr-types

ykneomgr-types —

## **Synopsis**

## **Description**

## **Details**

#### ykneomgr\_dev

```
typedef struct ykneomgr_dev ykneomgr_dev;
```

#### enum ykneomgr\_initflags

```
typedef enum {
  YKNEOMGR_DEBUG = 1
} ykneomgr_initflags;
```

Flags passed to ykneomgr\_global\_init().

YKNEOMGR\_DEBUG Print debug messages.

#### enum ykneomgr\_rc

```
typedef enum {
  YKNEOMGR_OK = 0,
  YKNEOMGR_MEMORY_ERROR = -1,
  YKNEOMGR_NO_DEVICE = -2,
  YKNEOMGR_TOO_MANY_DEVICES = -3,
  YKNEOMGR_BACKEND_ERROR = -4,
} ykneomgr_rc;
```

Error codes.

YKNEOMGR\_OK Success.

YKNEOMGR\_MEMORY\_ERROR Memory error.

YKNEOMGR\_NO\_DEVICE No device found.

YKNEOMGR\_TOO\_MANY\_DEVICES Too many devices found.

YKNEOMGR\_BACKEND\_ERROR Input/Output error.

## 1.3 ykneomgr-version

ykneomgr-version —

## **Synopsis**

#define	YKNEOMGR_VERSION_MAJOR	
#define	YKNEOMGR_VERSION_MINOR	
#define	YKNEOMGR_VERSION_NUMBER	
#define	YKNEOMGR_VERSION_PATCH	
#define	YKNEOMGR_VERSION_STRING	
const char *	ykneomgr_check_version	<pre>(const char *req_version);</pre>

## **Description**

#### **Details**

## YKNEOMGR\_VERSION\_MAJOR

```
#define YKNEOMGR_VERSION_MAJOR 0
```

Pre-processor symbol with a decimal value that describe the major level of the header file version number. For example, when the header version is 1.2.3 this symbol will be 1.

#### YKNEOMGR\_VERSION\_MINOR

```
#define YKNEOMGR_VERSION_MINOR 0
```

Pre-processor symbol with a decimal value that describe the minor level of the header file version number. For example, when the header version is 1.2.3 this symbol will be 2.

#### YKNEOMGR\_VERSION\_NUMBER

```
#define YKNEOMGR_VERSION_NUMBER 0x000000
```

Pre-processor symbol with a hexadecimal value describing the header file version number. For example, when the header version is 1.2.3 this symbol will have the value 0x01020300. The last two digits are only used between public releases, and will otherwise be 00.

#### YKNEOMGR\_VERSION\_PATCH

```
#define YKNEOMGR_VERSION_PATCH 0
```

Pre-processor symbol with a decimal value that describe the patch level of the header file version number. For example, when the header version is 1.2.3 this symbol will be 3.

#### YKNEOMGR\_VERSION\_STRING

```
#define YKNEOMGR_VERSION_STRING "0.0.0"
```

Pre-processor symbol with a string that describe the header file version number. Used together with <a href="https://www.ykneomgr\_check\_version">ykneomgr\_check\_version</a>() to verify header file and run-time library consistency.

#### ykneomgr\_check\_version ()

```
const char * ykneomgr_check_version (const char *req_version);
```

Check that the version of the library is at minimum the requested one and return the version string; return NULL if the condition is not satisfied. If a NULL is passed to this function, no check is done, but the version string is simply returned.

See YKNEOMGR\_VERSION\_STRING for a suitable req\_version string.

req\_version: Required version number, or NULL.

Returns: Version string of run-time library, or NULL if the run-time library does not meet the required version number.
